                                                                                                                                                      The invention relates to a novel pharmaceutical composition, which has a cfirst active agent comprising an oligonucleotide antisense to the cinitiation codon, coding region, 5 or 3' end genomic fianking regions, coding region, 5 or 3' end genomic fianking regions, coding region, 5 or 3' end genomic fianking regions, coding a polypeptide associated with lung and/or coding a polypeptide associated with lung and/or coding a polypeptide associated with lung and/or code antiinflammatory steroid and ubiquinone. A composition of the invention code in antiinflammatory, antiallergic, antiasthmatic, hypotensive, code immunosuppressive, and cytostatic activity. The composition may have a use in antiinflammatory, antiallergic, antiasthmatic, hypotensive, code immunosuppressive, and cytostatic activity. The composition may have a code in antiinflammatory gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also code in antiinflammatory steroid in a subject, for reducing or depleting levels of of receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, comparison, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at the printed of a fermination in the printed specification in the printed specification.

Miller S,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of updations or treating or depleting the prophylactic or the producing bronchodilation, increasing levels of updations or the producing bronchodilation, increasing levels of updations or the producing bronchodilation and the producing bronchodilation or treating the producing bronchodilation and the producing bronchodilation or treating the producing bronchodilation are producing bronchodilation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antialergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel pharmaceutical composition, which has first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         17-OCT-2003

                                                                                                                                                                    Best Local
                                                                                                                                                                                                Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or the composition is subject, for seducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or
                                                                                                                                                                                                                                                                                                                   lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allargies, or a respiratory disease or condition. Note: The eguence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel pharmaceutical composition, which has first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
                                                                                                                                                                                                                                                                  Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Disclosure;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human oligonucleotide sequence.

                                                                                                                                                                                                                                         The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC masal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine composition producing sensitivity to adenosine, reducing levels of adenosine composition inflammation, lung allergies, or a respiratory disease or condition. CC lung inflammation, lung allergies, or a respiratory disease or condition, the sequence data for this patent is not represented in the printed of a print who, inflament is not represented in the printed of a print who, inflament is not account of the printed of the p

                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel pharmaceutical composition, which has a clist active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also composition the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction, also sufflammatory in a subject's tissue, or treating bronchoconstriction.

                                                                                                                                                                                                                                                       The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or CC preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an CC antiinflammatory steroid in a subject, for reducing or depleting levels of antiinflammatory steroid in a subject, for reducing or depleting levels of receptor, producing bronchodilation, increasing levels of adenosine composition in flammation, lung allergies, or a respiratory disease or condition.

CC lung inflammation, lung allergies, or a respiratory disease or condition. The sequence data for this patent is not represented in the printed constitution, which is had not sequence.

                                                          S
                                                                                                                                                                                                                                                                                                          The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or CC preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an CC antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine conceptor, producing bronchodilation, increasing levels of ubiquinone or CC lung surfactant in a subject, tissue, or treating bronchoconstriction, CC lung inflammation, lung allergies, or a respiratory disease or condition. CC lung inflammation, but was obtained in electronic format directly from WIPO CC at fig. wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                      The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of Junctions of genes encoding a polypeptide associated with lung and/or CC masal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, have a CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of antiinflammation, lung allergies, or treating bronchoconstriction, clung surfactant in a subject stissue, or treating bronchoconstriction, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine or condition, lung allergies, or a respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at the print of the printed and print of the printed and print of the printed and printed an

                                                                                                                                                                                                                                  The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the cinitiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antianflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction, also sufficients in a subject, a tissue, or treating bronchoconstriction.

                                                                                                                                                                                                              initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of demosine receptor, producing bronchodilation, increasing levels of adenosine lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

        The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo. The isolated human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo. The isolated human gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for displaced to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polynucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism in a human gene. This polynucleotide sequence represents

                                                                                                                                             The invention relates to a drug resistance gene (I) obtained by introducing a mutation in a gene involved in drug sensitivity of a shiitake mushroom. The gene involved in drug sensitivity of a shiitake mushroom encodes a succinate dehydrogenase Ip subunit, where the drug carboxin. (I) is useful for providing resistance of shiitake mushroom
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              polymorphisms in human gene. The isolated human gene is also useful for disgnosis of disease and determination of side effect to a medical agent The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polynucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism

The oestrogen receptor alpha protein is also known as oestrogen receptor 1, ESR1, and NR3A1. Oestrogen, the steroid hormone ligand of ESR-alpha, is important for bone maintenance and plays a protective role in the cardiovascular system, as well as being required for normal sexual maturation through promoting growth and differentiation. Splice variants of ESR-alpha, however, have been associated with variance.
                                                                                                                                                                                                                                                                                                                                                                                          of ESR-alpha, however, have been associated with various cancers including the breast and pituitary. Accordingly, antisense oligonucleotides that inhibit the expression of ESR-alpha in cells or tissues can be used in gene therapy to treat conditions such as hyperproliferative disease, inflammation, tumour formation and to prevent or delay infection. As such, the present invention describes these antisense oligos as having cytostatic, antiinflammatory and antimicrobial activities. This oligonucleotide sequence is an antisense oligo used to inhibit expression of human oestrogen receptor alpha of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to novel G-protein coupled receptors (GPCRs) and the nucleic acids encoding them. The invention is useful for treating viral, bacterial and fungal infections, inflammatory and neoplastic processes, pain, diabettes, hypertension, osteoporosis, cancer angina pectoris, myocardial infarction and atherosclerosis. The present sequence is G-protein coupled receptor (GPCR) related primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          hypertension; osteoporosis; antibacterial; cytostatic; fungicide; pain; diabetes; cancer; virucide; analgesic; cardiant; primer; ss.

                                                                                                                                                                                                                                                                                                                                                           This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonuclectides. CTGF has been mapped to human chromosome region 623.1, and is also known as ctgrofact, fibroblast inducible secreted protein, fisp-12, NV2, insulin-like growth factor binding protein-related protein 2, IGFBP-rP2, IGFBP-8, Hcs24 and ecogenin. It is known to stimulate DNA synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonucleotides that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative disorders (particularly cancer, e.g. breast, prostate or renal cancer), pulmonary fibrosis, renal fibrosis, seleroderms and atherosclerosis. As
                                                                                                                                                                                                                                                                        such, the present invention describes these antisense oligos as having cytostatic, dermatcological and antiarterioscalerotic activities. This oligonucleotide sequence is a chimeric phosphorothicate antisense oligowith 2' MOB wings and a deoxy gap, which is used to inhibit expression human CTGF of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotides for modulating connective tissue growth factor expression, particularly useful for treating cancers (e.g. breader prostate cancer), pulmonary or renal fibrosis, scleroderma or

The Zmsel polypeptides are useful as research reagents and as an amino acid source for cell culture. The Zmsel present in heart and skeletal muscle are useful in promoting wound healing effects and exhibits anti-bacterial or anti-viral effects. The Zmsel polypeptides are useful for treating inflammatory conditions such as asthma, arthritis, diverticulitis. The Zmsel polypeptide is useful for treating cancer, vasoconstriction, heart inflammation. The Zmsel polypeptide is useful as an immunogen to elicit an immune response in an animal. The Zmsel polypeptide is useful as an immunogen to elicit an immune response present sequence represents a mouse Zmsel sequencing primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated polynucleotide encoding a Zmsel polypeptide. Cells expressing the nucleic acid are useful for producing polypeptides. The nucleic acid is useful as probes or primers to clone on non-coding regions of Zmsel gene. The nucleic acid is also useful for detecting allelic differences between diseased or non-diseased
                                                                                                                                                                                                                                                                                                ADB81408 standard; DNA; 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polynucleotide encoding Zmsel polypeptide having a Cdc42/Rac interactive binding (CRIB) motif, useful for diagnosing and treating cancer and inflammatory conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  primer; mouse; ss; sequencing; Zmse1; wound healing; anti-bacterial;

                                                                                                                                                                                                                                                                                                                             RESULT 1474
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       transport ATPase-like protein polypeptide is also claimed, the method comprises culturing the host cell under conditions suitable for the expression of the polypeptide, and recovering the polypeptide from the host cell culture. The protein of the invention has neuroprotective, nootropic, antiparkinsonian, cardiant, analgaesic, antiarrhythmic, nootropic, antiparkinsonian, cardiant, analgaesic, antiarrhythmic, hypotensive, nephrotropic, uropathic, cytostatic, vasootropic, and antianaemic activity. The polymucleotide may have a use in gene therapy. The polymucleotide and polypeptide are useful in identifying test compounds which may act as agonists or antagonists at the receptor site and which can be regulated to provide therapeutic effects. The expression vector or reagent is useful in the preparation of a medicament for modulating the activity of a cation transport ATPase-like protein in a disease, e.g. a central nervous system (CNS) disorder, a cardiovascular (All claimed.) In particular, these diseases and althemer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                           S
                                                                                                                                                                                      CC connective tissue growth factor (CTGF) by antisense oligonucleotides.

CC CTGF has been mapped to human chromosome region 623.1, and is also known as ctgrofact, fibroblast inducible secreted protein, fisp-12, NOV2, as ctgrofact, fibroblast inducible secreted protein, fisp-12, NOV2, consulin-like growth factor binding protein-related protein 2, IGFBP-IP2, IGFBP-B, Hcs24 and ecogenin. It is known to stimulate DNA synthesis and CC promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonucleotides CC that inhibit the expression of CTGF in cells or tissues can be used in CC gene therapy to treat various conditions including hyperproliferative CC disorders (particularly cancer, e.g. breast, prostate or renal cancer), pulmonary fibrosis, renal fibrosis, scleroderma and atherosclerosis. As CC such, the present invention describes these antisense oligos as having CC oligonucleotide sequence is a chimeric phosphorothicate antisense oligo with 2 MCS wings and a decoxy gap, which is used to inhibit expression of the invention.

FXR is also known as NRIH4, retinoid X receptor-interacting protein 14 (RIP14) and bile acid receptor (BAR). The antisense oligonucleotide is useful for inhibiting the expression of human FXR in cells or tissues. It is particularly useful for treating or preventing a disease or condition associated with FXR in a human, e.g. cardiovascular disease, atheroscierosis or hypercholesterolaemia. The antisense compound is useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. It is also used in gene therapy. The present sequence is an antisense oligonucleotide targetted to human FXR DNA. This sequence

The compounds of the invention are useful for preparing compositions for treating neurodegenerative diseases e.g. hyperproliferative or autoimmune disorders. The invention is also used in gene therapy. The present sequence is an antisense oligonucleotide targetted to human PLSCR3 DNA

The antisense oligonucleotides were CC designed to target different regions of the human or murine acyl coenzyme CC A cholesterol acyltransferase-1 RNA, and were analysed for their effect CC on acyl coenzyme A cholesterol acyltransferase-1 mRNA levels by CC quantitative real-time PCR. Acyl coenzyme A cholesterol acyltransferase CC (ACAT) enzymes catalyse the synthesis of cholesterol acyltransferase CC cholesterol and fatty acyl-COA, and are also involved in regulating the CC concentration of cellular free sterols. The murine acyl coenzyme A CC cholesterol acyltransferase-1 gene is located on chromosome 1. The CC oligonucleotides of the invention are useful for the prevention and CC treatment of conditions associated with acyl coenzyme A cholesterol coetave metabolism, e.g., atherosclerosis or cardiovascular disease. CC Cholesterol metabolism, e.g., atherosclerosis or cardiovascular disease. CC cholesterol metabolism, e.g., atherosclerosis or cardiovascular disease. CC expression of acyl coenzyme A cholesterol acyltransferase-1

The method involves collecting data indicating chondrocyte cell viability for use in cartilage regeneration and providing a certification of chondrocyte cell viability including the data. The method is useful for certifying viability of chondrocyte cells for use in cartilage regeneration, particularly for autologous chondrocyte implantation. The method is useful for producing a quality assurance certificate for a given chondrocyte cell culture. It may also be used for determining the likelihood of hyaline cartilage regeneration in a patient with a cartilage defect. The invention is also useful for cell therapy. The present sequence is collagen II May specific RT-PCR

The composition is considered osteopathic and a growth factor regulator and useful for treating osteogenesis, tenogenesis, chondrogenesis, bone, tendon and cartilage defect. The present invention relates to a primer selected from separate exons of interest and used during the

Also described: (1) a composition comprising the compound and a carrier or diluent, (2) a method of inhibiting the expression of phospholipase A2, group IIA in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with phospholipase A2, group IIA (synovial). (1) has antiinflammatory, antidiabetic, cytostatic and antipsoriatic activities, and can be used in vaccines and in gene therapy. The compound (1) can be used for preparing a composition for treating or preventing inflammation, cancer, psoriasis or diabetes. The present sequence represents a human phospholipase A2 group IIA (synovial) chimeric phosphorothioate antiense oligonucleotide, which is used in an example for the present of the properior of the present of the properior of the present of the properior of the properior of the present of the properior of t

The method of the invention has thrombolytic and haemstatic activity. The methods and compositions of the present invention are useful for the diagnosis and treatment of, and/or analysing risks for thrombotic thrombocytopenic purpura. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                          Oligo ISIS 124654 for CD40 ligand
                                                                                                                                                                                                                                        30-MAY-2003
                                                                                                                                                                                                                                                                                              ACC44063 standard;

                                                                                                                                                                               CC human CD40 ligand gene. The oligonucleotides contain either content either content either content either content either mucleotide bonds or have a peptide amide backbone replacing the usual phosphodiester cc internucleotide bonds or have a peptide amide backbone replacing the central 10 mucleotides flanking the central 10 mucleotides flanking the central 10 mucleotides are useful for modulating the expression of CD40 ligand and for treating cc diseases or conditions associated with expression of CD40 ligand, e.g. cc cancer, autoimmune disorder, inflammatory disorder, or a disease or condition arising from aberrant apoptosis. The antisense compounds are callso useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent cc or delay infection, inflammation or tumor formation, as research reagents cand kits, and in distinguishing between functions of various members of a biological pathway. Oligonucleotides ACC44014-ACC44091 represent the function for formation of the human form time formation of the human form time formation of the human form time formation of the human formation human formation of the human formation human formatio

                                                                                                                                  The invention describes a method for amplifying a nucleic acid fragment comprises using a non-cyclic single-stranded target nucleic acid as template and performing a strand displacement primer elongation reaction with use of a first primer having a sequence complementary to the target nucleic acid fragment to form a nucleic acid fragment. The method is for amplifying non-cyclic nucleic acid fragments, which is applicable in e.g. gene analysis, disease diagonats and identification of pathogenic microbes. The amplification can be efficiently performed. This sequence represents a primer associated with the non-cyclic nucleic acid amplification method described in the invention
                                                                                                                                                                                                                                                                                                                                Method for amplifying non-cyclic nucleic acid fragments with single-
stranded target nucleic acid fragment as template, applicable in e.g.
gene analysis, disease diagnosis and identification of pathogenic

The method is useful for identifying potential therapeutic, prophylactic and/or toxic agents for the treatment of diseases caused by an alteration in the expression profile of the transporter polynpeptides. PCR primers ABV71166-67 were used to amplify a non-conserved region of the rat GABA-1 transporter (GAT), designated 1-250. The amplified fragment was cloned, and used produce a transport array to demonstrate the method of the

The present invention describes a method for identifying a compound that chinduces senescence in a mammalian cell comprising culturing the cell in the presence and absence of the compound, assaying expression of at least one cellular gene (G1a) from 56 or a gene (G2) from 64 genes, with corresponding accession numbers given in the specification, and identifying compounds that induce senescence when expression of (G1a) or expression of (G2) is lower, in the presence of the compound. Also described: (1) a compound that induces senescence in a mammalian cell; (2) assessing efficacy of a treatment of a disease or condition relating to abnormal cell proliferation or neoplastic cell growth; (3) treating a disease or condition relating to abnormal cell proliferation or neoplastic cell growth; (4) identifying a compound that inhibits senescence-associated induction of cellular gene expression. The compound is useful for treating or for assessing efficacy of treatment of a disease or condition relating to abnormal cell proliferation or neoplastic cell growth. The compound cell proliferation or a disease or condition relating to abnormal cell proliferation or neoplastic cell growth. The compound of the invention has a growth-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The method of the invention is useful for detecting an mRNA that is expressed in a species of Mycobacterium (e.g. Mycobacterium tuberculosis). The present DNA sequence represents a Mycobacterium-specific nucleotide which can be used as a primer or probe in the method of the invention (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying a compound that induces senescence in a mammalian p53 deficient or tumor cell comprises assaying expression of cellular in the presence of the compound with expression of the genes in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          21-DEC-2000; 2000US-0257907P.

                                                                                                                                          The present invention describes a method (M1) for designing capture oligonuclectide probes (I) for use on a support to which complementary oligonucleotide probes (I) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Cryptococcus neoformans, Candida albicans and aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and paramatic infectious agents selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            inhibitory effect without producing systemic side effects found with other growth-inhibitory compounds. ABQ74611 to ABQ74734 represent PCI primers which are used in an example from the present invention
Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       oncogene; tumour suppressor; human papillomavirus; forensic;

                                                                                                                   The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for disgnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a mouse oligonucleotide relating to the TNFR1 of the invention
                                                                                                                                                                                                                                                                                                                                                   Novel antisense compound targeted to nucleic acid molecule encoding tumon necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer
                                                                                          Sequence

The D genome is thought to have been introduced in the CC most recent intercrossing, between the amphiploid AABB and Triticum causchii (DD), probably involving only a limited number of genotypes of coth species. Due to its polyploid genome, the large size of its genome, can dist low level of polymorphism, the genetic mapping of wheat has to between one and six nucleotides long, and are very polymorphic in length, comainly due to polymerase slippage during replication. This high degree of polymorphism makes them especially suitable for the genetic mapping of wheat has to a polymorphism makes them especially suitable for the genetic mapping of inheritance. The 185 microsatellite markers of the invention are developed from the ancestral diploid donor species Triticum tauschii and companies. These microsatellite markers thus help to overcome some of the problems associated with the genetic mapping of wheat. The wheat D genome map and the microsatellite markers and associated primers of the companies. These microsatellite markers and associated primers of the companies and for identifying development factors, quality factors and factors conferring resistance to pathogens and xenobiotics. The microsatellite markers hus help to overcome some of the companies which is primers and xenobiotics. The microsatellite markers and associated primers of the companies which markers, and associated primers of the companies and for identifying development factors, quality factors and factors conferring resistance to pathogens and xenobiotics. The used in a constant of the companies of the companies whether or not a product comprise wheat or a related species; for identifying cultivars and hybrids of companies whethe

```
The invention relates to a compound of 8-50 nucleobases in length CC targeted to a nucleic acid encoding protein phosphatase 1B (PTP1B), where CC the compound specifically hybridises with and inhibits the expression of CC PTP1B (e.g. an antisense oligonucleotide). Also included are (1) a CC compound of 8-50 nucleobases in length which specifically hybridises with a CC compound of 8-50 nucleobases in length which specifically hybridises with CC and mucleobase portion of an active site on a nucleic acid encoding CC pTP1B; (2) inhibiting the expression of PTP1B in cells or tissues CC comprising contacting the cells or tissues with the compound; treating an animal having or suspected of having a disease or condition associated CC with PTP1B in an animal comprising administering the compound; (5) CC preventing or delaying the onset of a disease or condition associated CC with PTP1B in an animal comprising administering the compound; and (6) CC with PTP1B in an animal comprising administering the compound; and (6) CC prevent or delaying the onset of an increase in blood glucose levels CC prevent or delay the onset of an increase in blood glucose levels CC prevent or delay the onset of a disease or condition associated with CC prevent or delay the onset of a disease or condition associated with CC prevent or delay the onset of a disease or condition associated with CC prevent or delay the onset of an increase in blood glucose levels or preventing or delaying the onset of an animal having or suspected of having the disease or condition, and for CC decreasing blood sugar levels or preventing or delaying the onset of an increase in blood glucose levels or preventing or delaying the onset of an increase in blood glucose levels or preventing or delaying the onset of an increase in blood glucose levels or preventing or delaying the onset of an increase in blood glucose levels or preventing or delaying the onset of an increase or condition, and for concer, condition, and for concern or preventing or delaying the onset of an 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 3; Page 29; 133pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              associated with Lysophospholipase I e.g. inflammation, hyperlipidaemia, and cardiovascular disorders such as atherosclerosis and myocardial ischaemia. (I) is useful as research reagent and disgnostics. (I) is all useful for distinguishing functions of various members of a biological pathway. (I) is useful in antisense gene therapy. ABK37028-ABK37191 represent lysophospholipase I coding sequences, antisense oligonucleotides and related PCR primers of the invention. Note: Antisense oligonucleotides are modified such that bases I-5 and 16-20 & 2'-methoxyethyl (2'-MOE) nucleotides, all bases have phosphorothioate linkages, and all cytidines are 5-methyl cytidines
                                                                                                                                                                                                                                                                                                                                                                                                                                              depression; mental retardation; neurodegenerative disease; antibacterial; Alzheimer's disease; dementia; ischaemia; Parkinson's disease; antiviral; Huntington's disease; anxiety; antifungal; immunosuppressive; cytostatic; vulnerary; analgesic; anorectic; anabolic; diuretic; cardiant; nootropic; antiemetic; vasotropic; diabetes; cancer; tranquillizer; neuroleptic;

The antisense oligonucleotides can be used in a composition to modulate the expression of MEKK2 (AAV03599). The antisense oligonucleotides are useful for inhibiting the expression of MEKK2 in the treatment of immunological disorders, inflammatory disorders and hyperproliferative disorders e.g.

The invention relates to an isolated polypeptide, comprising a variant CCC form of mouse or human SAC1 polypeptide. The variant form is associated CCC with altered preference for carbohydrates, other sweeteners or ethanol. CCC The polypeptide and its associated DNA sequence can be produced by recombinant techniques and is useful for preventing obesity, diabetes or calcoholism associated with SAC1 expression. The sequences are useful in screening for drugs and sweeteners. Recombinant cell lines and transgenic embryos may be used in screening for and identifying agents that induce cc or repress function of SAC1. Predisposition to diabetes, obesity or calcoholism can be ascertained by testing any fluid or tissue of a human cc such as blood, pancreas or tongue) for sequence variations of the SAC1 gene. A sequence variation of the SAC1 locus may indicate a predisposition to diabetes, obesity and/or alcoholism and may provide a cdiagnostic mark. The polymutleotide can be detected in a biological sample by contacting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent cDNA encoding human and contacting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent cDNA encoding human and contacting the DNA with a probe to form a hybridisation complex contacting the DNA with a probe to form a hybridisation complex contacting the DNA with a probe to form a hybridisation complex contacting the DNA with a probe to form a hybridisation complex contacting the DNA with a probe to form a hybridisation complex contacting the DNA with a probe to form a hybridisation complex contacting the DNA with a probe to form a hybridisation complex contacting the DNA with a probe to form a hybridisation complex contacting the DNA with a probe to form a hybridisation complex contacting the DNA with a probe to form a hybridisation complex contacting the DNA with a probe to form a hybridisation complex contacting the DNA with a probe to form a hybridisation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 1451
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ફ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention provides an agent comprising a pyrone compound or dihydroxy compound of specified formulae given in the specification. The agent is used for correcting gene expression regulation errors. Errors in the following genes may be corrected: IL-6, IL-10, hemeoxygenase-1, prostaglandin G/H synthase-2, macrophage inflammatory protein-1-alpha, RANTES, IL-1alpha, IL-1beta, TNF alpha, IL-7 receptor, macrophage inflammatory protein-1-beta, liver and activation-regulated chemokine, macrophage inflammatory protein-2-beta, macrophage inflammatory protein-1-beta, commacrophage inflammatory protein-2-beta, macrophage inflammatory protein-1, macrophage inflammatory protein-1.

Commacrophage inflammatory protein-2-alpha, growth regulated protein-1, macrophage inflammatory protein-2-beta, and 1920zymm, GABA(A) receptor-associated protein, interferon-induced 17-kDa/15-kDa protein, interferon-inducible protein, interferon-induced 17-kDa/15-kDa protein Ala receptor, CD37 antigen properdin p factor, regulator of G-protein signaling-2, Nef-associated factor-1, myeloid leukemia cell differentiation protein-1, signal peptidase complex, and also side-effects caused by them such as inflammation. CC hNck-beta and Grb4), contains both SH2 and SH3 src homology domains and Cf functions as an adapter protein in integrin-mediated and receptor cyrosine kinase-mediated signal transduction, particularly in growth factor receptor signalling. Moreover, Nck-2 participates in pathways that connect growth factor receptor signalling and integrin signalling via its connect growth factor receptor signalling and integrin signalling via its connect growth factor, a LIM domain-containing adapter protein which is its connect in the signal, a LIM domain-containing adapter protein which is its convolved in integrin, growth factor and Wnt signalling pathways. Nck-2 also interacts with EGF (epidermal growth factor) and PDGF (platelet-derived growth factor) receptors, inhibiting EGF- and PDGF-stimulated DNA cynthesis in an SH2-dependent manner. Nck-2 is also able to interact with v-Abl, Ras and Sos proteins to induce transcriptional activation, and is therefore implicated in the development of cancer, particularly leukaemia cand breast cancer. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with Nck-2 expression, such as leukaemia and breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequences AAC92649-C92728 represent antisense oligonucleotides targetted to the human Nck-2 gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nck-2 mRNA; and were analysed for their effect on Nck-2 mRNA levels t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is one of a number of antisense compounds of up to 30 nucleobases in length that are capable of inhibiting the expression of phosphoenol pyruvate carboxykinase-cycosolic (PEPCK-cytosolic). The antisense compounds are useful for inhibiting the expression of PEPCK-cytosolic in cells or tissues. They are commonly used as research reagents and in diagnostics, e.g. to elucidate the function of particular genes. They are also useful for distinguishing between functions of various members of a biological pathway and for research use. The antisense compounds are also useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence

The present invention relates to DNA and protein for zmsel, a novel human CC Cdc42/Rac interactive binding (CRIB) protein. CRIB proteins are conditions are useful for modulating tumour cell motility. Invasion and commetastasis, gene transcription, contractility of various tissues, actin collymerisation and cytoskeletal reorganisation, digestion, testicular cfunction and fertility. Zmsel sequence and its modulators are useful for treating cancer, inflammatory heart or cardiovascular conditions, muscle inflammatory bowel diseases or diverticultis, myocarditis, seleroderma, cinflammatory diseases or diverticultis, myocarditis, seleroderma, cinflammatory diseases, male infertility or as male contraceptive agents and for modulating spermatogenesis and sperm capacitation. zmsel and anti czmsel antibodies are useful in diagnosing inflammatory diseases, such as reperfusion ischaemia, psoriasis, arthritis, melanoma and other inflammatory diseases, male reproductive cancers such as prostate and ctesticular cancers. Zmsel polymucleotide sequences are useful as probes or primers for detecting human chromosomal abnormalities. zmsel sequence cis used in gene therapy. The present sequence is ZC19,270 primer used for contracers contraced contraced contracers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 4; Page 128; 132pp; English.

These ASOs are complementary to regions of the human gene (see AAF90491) for the pro-alpha-1 chain of type I procollagen. They are capable of inhibiting the expression of type I procollagen pro-alpha-1 chain in a cell that expresses it. The ASO, or a pharmaceutical composition including it, is used in a claimed method of treating, or reducing a risk of, a collagen disorder. Such disorders may include those caused by overproduction of collagen fibres, such as liver cirrhosis, kidney, liver and heart fibrosis, scleroderma, hypertrophic scars and keloids. The present ASO, when administered to human WI-26 cells, inhibited type: I collagen

Also described are methods of using these compounds for the modulation of caspase 3 expression. The caspase antisense oligonucleotides specifically hybridise with and inhibit the expression of caspase 3 Antisense compounds targeted to caspase 3 are useful to inhibit caspase 3 expression in cells or tissues and to modulate apoptosis. The caspase 3 antisense oligonucleotides are useful for treating disorders associated with expression of caspase 3. Such disorders include hyperproliferative disorders (e.g. cancer), viral infections (e.g. hepatitis), haematopoietic disorders, autoimmune disorders, atherosclerosis and neurological disorders (e.g. Alzheimer's

More CC generally, antisense compounds (I) comprising antisense oligonucleotides of 5-50 bases targeted to a nucleotide sequence encoding groEL (heat CC shock protein (HSP)60) (GL) and groES (HSP10) (GS) gene from a CC microorganism, where the antisense compound is complementary to GL or GS of a microorganism and specifically hybridises with and inhibits the CC expression of GL or GS, is claimed. (I) have antibacterial, antiviral and CC expression of GL or GS, is claimed. (I) have antibacterial, antiviral and CC expression of GL or GS, and can be used in antisense therapy and CC for inhibition of expression of GroES or groEL. (I) are useful for inhibiting the growth of a microorganism, or inhibiting the expression of GL or GS gene in a microorganism, or inhibiting CC the expression of GL or GS gene which involves administering to the CC microorganism or to a cell infected with the microorganism, (I). (I) are CC microorganism or to a cell infected with the microorganism, (I). (I) are CC microorganism which involves identifying a cutaryotic organism or to a cell with the microorganism shaving a GL or GS gene and administering (I) such that the growth of microorganism is inhibited. The antisense compounds are utilised for diagnostics, to complete weight markers and sar esearch reagents and kits, e.g., to constant or delay microbial infections in humans. They are also useful as condition and anticon to antifect and with the microorganism is considered by microbial infections in humans. They are also useful as

The antisense compounds are useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The antisense oligonucleotides are useful for treating an animal, particularly a human, suspected of having or being prone to a disease or condition associated with the expression of zinc finger protein-217. In particular, the antisense oligonucleotides are useful for preventing, delaying or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense oligonucleotides for modulating the expression of zinc finger protein-217, particularly useful for preventing, delaying or treating infection, inflammation or tumor formation.

                                                                                                        The present invention provides antisense oligonucleotides with phosphorothicate backbones directed at the human E2F transcription factor 3 (E2F-3) coding sequences. These can be used in the therapy of diseases which can be treated by modulating E2F-3 expression and to prevent infection, inflammation and tumour formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is one of a number of antisense compounds of 8 to 30 nucleobases in length that have been designed to target a 5'untranslated region, start codon, coding region or 3'untranslated region of the human receptor activator of NP-kappaB (RANK). The antisense compounds specifically hybridise with and inhibit the expression of RANK. The antisense oligonucleotides are useful for inhibiting the expression of human RANK in human cells or tissues. They can be utilised for diagnostics, therapeutics for the treatment of diseases associated with the expression of RANK, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, and as research reagent. The antisense compounds are safely and effectively administered to humans
                                                                                                                                                                                                                              Novel antisense compounds targeted to E2F transcription factor 3 diagnosis, prophylaxis and treatment of diseases associated with transcription factor 3 such as infection, inflammation or tumor
                                                                                 Sequence
                                                                                                                                                                                          Example 15;
                                                                                                                                                                                                                                                                                                                                                                       24-FEB-2000; 2000US-00513729
                                                                                                                                                                                                                                                                                                                                                                                                 24-FEB-2000; 2000US-00513729
                                                                                                                                                                                                                                                                                                                                                                                                                            26-DEC-2000

(I) has cytostatic and antinifiammatory activity, and can be used in antisense therapy and as a modulator of daxx. (I) is useful for inhibiting the expression of daxx in cells or tissues in vitro. (I) can be utilised for diagnostics, therefore the treatment of diseases associated with the expression of daxx, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation and as research reagent. The present sequence represents an inhibitory human daxx antisense phosphorothoate oligonucleotide which

It is a scrambled sequence derived from oligonucleotide 13793 which is complementary to a portion of the start codon region (91-110) of human thymidylate synthase gene. It is capable of modulating the expression of thymidylate synthase by hybridising to the specific target region on the gene. This oligonucleotide inhibits cell proliferation when a therapeutically or prophylactically effective amount is administered. It can be used for diagnosis and treatment of hyperproliferative diseases like cancer and to distinguish thymidylate synthase-associated tumours
                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 20 BP; 1 A; 5 C; 13 G; 1 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is one of a large number of antisense oligomucleotides which are targeted to nucleic acids encoding fra-1. The sequences may be oligodeoxyribonucleotides or chimeric oligonucleotides, which is flanked on both sides by 2'-methoxyethyl (2'-MOE) wings. The oligonucleotides have a phosphorothioate backbone and the cytidine residues in the 2'-MOE wings are 5-methylcytidines. The fra-1 antisense oligonucleotides are useful for inhibiting the expression of fra-1 in human cells or tissues. They can be used for diagnostics, therapeutics, prophylaxis and as research reagents and in kits. Use of the antisense compounds may also be useful prophylactically, e.g. to prevent or delay
                    Novel antisense compounds capable of modulating expression receptor activator of NF-kappaB useful for diagnosis, prophtreatment of diseases associated with expression of RANK.

                                                                                                                                                                                                                                                                                                                                                                                                                         containing a mutant EphA4 gene. Targeted disruption of the EphA4 gene was achieved by homologous recombination in ES cells. The mutant allele should contain a neomycin-resistance gene within the EphA4 gene. The present sequence hybridises to exon III of the ephA4 gene. A 600 bp band is generated from the mutant allele whereas a 645 bp product is generated from the wild type allele. EphA4 deficient mice were used to show that increasing levels of the Eph receptor, or a ligand for the receptor, facilitates regeneration, growth and development of the central nervous system. Eph receptors or their ligands can be used to regulate axon guidance and to facilitate the repair or replacement of nervous tissue in an animal or bird in response brain or spinal cord injury or a disease of the upper motor neuron or central nervous system. Such disease include

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                is useful for the diagnosis of liver regeneration and/or liver cell proliferation. Anti-rap3 antibodies, PCR primers and nucleotide sequences which act as probes are useful for detecting the occurrence of liver cell proliferation in a patient. Single stranded oligonucleotides that are complementary to RAP3 can be used as probes to detect the amount of mRNA transcribed from RAP3 present in a sample such as a liver biopsy, plasma or serum of a tissue or body fluid in comparison to a reference sample. The probes can also be used for screening a liver CDNA or genomic library. The rap3 protein is useful for enhancing the growth or regeneration of liver tissue. The methods of the invention can be used to establish the efficacy of therapeutic agants stimulating liver regeneration and for patients who have undergone liver transplantation and for monitoring patients treated with a bioartificial liver

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a PCR primer which is based on the rat RAP3 gene. The RAP3 gene and rap3 protein are involved in the regeneration processes of the liver, and the RAP3 gene is expressed specifically in the liver. The RAP3 gene is useful for designing PCR primers (such as present sequence) and probes for detecting nucleotide sequences in a source material and as a marker of liver proliferation. The rap3 prote

                                                                                                                                                                                                                                                                                         AAZ92701;
                                                                                                                                                                                                                                                                                                                    AAZ92701 standard; DNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sequence. The RAP3 (regeneration association protein 3) gene is involved in regeneration processes of the liver. The RAP3 gene was found to be upregulated 6 hours after partial hepatectomy, after which it is downregulated. The PCR primers are useful for detecting nucleotide sequences in a source material. The RAP3 cDNA sequence is useful as a marker of liver proliferation. The RAP3 protein is useful for the diagnosis of liver regeneration and liver cell proliferation. RAP3 antibodies, PCR primers and probes are useful for detecting the occurrence of liver cell proliferation in a patient. The RAP3 protein is also is useful for enhancing the growth of regeneration of liver tissue
                                                                                                                                                       single nucleotide polymorphism; detection; diagnostic; disease susceptibility; cardiovascular disease; inflam rheumatoid arthritis; PCR primer; ss.

```
CC The invention relates to a novel method of diagnosing a single nucleotide CC polymorphism (SNP) in the human C-C chemokine receptor-2 gene (CCR-2). CC The method of the invention comprises determining the nucleic acid sequence at at least 1 of 13 specific positions in the coding region of the CCR-2 gene (RMEL U8024) polymorphisms at positions 2385 and 2649 are CCR-2 gene (RMEL U8024) polymorphisms at positions 2385 and 2649 are CCR-2 gene (RMEL U8024) polymorphisms at positions 2385 and 2649 are CCR-2 gene (RMEL U8024) polymorphisms at positions 2385 and 2649 are CCR-2 gene (RMEL U8024) polymorphisms at positions 2385 and 2649 are CCR-2 gene (RMEL U8024) polymorphisms at positions 2385 and 2649 are CCR-2 gene (RMEL U8024) the polymorphisms that cam be detected are at positions 2385 and 2649 are CCR-2 diagnostic by the comprising the diagnostic primers and probes for detecting these CCR-2 diagnostic by the comprising the diagnostic primers and probes, and CCR-2 diagnosing stope in the CCR-2 gene and is therefore useful in assessing CCR-2 diagnosing stope in the CCR-2 gene and is therefore useful in assessing CCR-2 ligand services and cardiovascular diseases which are cCR-2 ligand mediated diseases in humans such as rheumatoid composing stope and cardiovascular diseases which are cCR-2 ligand mediator diseases in humans such as rheumatoid carthritis and other inflammatory diseases. The SMP identification method composites targeting allelic variants of the CCR-2 gene. Computer readable mediator diseases and developing new drug demanded other subgrouphism-containing nucleic acids are useful in characterising individuals in terms of computer section and the patient's susceptibility to treatment with particular cCC drugs. SNPs of the CCR-2 gene are useful as genetic markers in linkage conformation in a computer readable mediator. Sequence S2700-S2701 is the cCR-2 promocer (EMBL U9526). Primer Z92700 is the cCR-2 promocer (EMBL U9526). Primer Z92700 is the cCR-2 promocer (EMBL U9526). Primer Z92700 is the cCR diagn
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 2; Page 25; 35pp; English.

                                                                                                                                                                                                                                                                     AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX94584 - AAY35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               frames of the C. pneumoniae genome (see AAY34584- AAY35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumonucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990) C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584 AAY35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
